# Today We Will Be Learning About:

- Centering Images via FlexBox and Div Tags

# Flexbox:

- Flexbox is a part of CSS that provides a more efficient way to lay out, align and distribute space among items in a container.
- It is most efficient when called inside DIV tags since there are multiple elements within it
- There are many types of flexbox elements you can use, but the most important ones include justify-content, flex-direction, and align-items

# Flexbox (CSS):

- Define your Div Tag and put a class in it in HTML and put elements inside of it (text, images, etc.)
- Then, go to your CSS and call the class
- The first thing you need to do is put:
  - `display: flex;`
    - So that the computer knows you're trying to flex elements

# Flex-Direction:

- Everything in your div box will be displayed in one of the four directions:
  - row
  - row-reverse
  - column
  - column-reverse

# Flex-Direction (CODE):

- HTML:

- `<div class = "flexPics">`
  - `<img src = "...">`
  - `<img src = "...">`
- `</div>`

- CSS:

- `.flexPics{`
  - `display: flex;`
  - `flex-direction: column;`
- `}`

# Justify-Content:

- Aligns elements on the x-axis of your website
- The content that you can use for justify-content includes:
  - flex-start
  - flex-end
  - space-around
  - space-between
  - center
  - space-evenly

# Justify-Content (CODE):

- HTML:
  - `<div class = "flexPics">`
    - `<img src = "...">`
    - `<img src = "...">`
  - `</div>`
- CSS:
  - `.flexPics{`
    - `display: flex;`
    - `flex-direction: column;`
  - `}`

# Align-Items:

- Aligns elements according to the Y-axis
- The contents that you can use include:
  - flex-start
  - flex-end
  - center
  - baseline
  - stretch

# Align-Items (CODE):

- HTML:

- `<div class = "flexPics">`
  - `<img src = "...">`
  - `<img src = "...">`
- `</div>`

- CSS:

- `.flexPics{`
  - `display: flex;`
  - `align-items: center;`
- `}`
